

WHAT COULD BE IN THIS CBD GUMMY?

Unknown levels of CBD.

The FDA conducted a sample study of the current CBD marketplace. Out of more than 140 products tested, 102 indicated a specific level of CBD. More than half of those were mislabeled, and contained more or less CBD than advertised.

Nearly 40 products had more than 120% of the CBD level listed.

Unknown health risks.

The FDA has stated that it **cannot** give CBD its “Generally Recognized as Safe (GRAS)” designation for use in food and beverage products.

Elevated CBD levels may cause liver damage and/or have negative reactions with other medications.

Harmful contaminants.

Independent testing of the 240 top-selling CBD products found that 70 percent were contaminated with substances including lead, arsenic, herbicides, pesticides, and toxic mold.

THC – the cannabinoid responsible for psychoactive effects.

CBD products may contain enough THC to cause impairment, impact drug tests, and more. **A recent FDA report to Congress found that nearly 20 of the top CBD products the agency tested contained THC.**

The American Association of Poison Control Centers has reported over **5200 CASES** related to CBD in the last two years.

Currently, CBD products are not reviewed or tested by the FDA to ensure safety. **UNTESTED, UNAPPROVED CBD PRODUCTS POSE A GROWING THREAT TO PUBLIC HEALTH.** Lack of oversight or independent testing combined with unreliable labels make CBD products like gummy bears that appeal to young children especially dangerous.
